Orbach, Huff, Suarez & Henderson, LLP 1901 Avenue of the Stars, Ste 575 Los Angeles, CA 90067

Attention: Mr. Stan Barankiewicz II, Esq.

Subject: INVESTIGATION OF RELATIVE HUMIDITY, TEMPERATURE, AND DEW POINT Bridgeport Elementary School 23670 Newhall Ranch Road Santa Clarita, California

Dear Mr. Barankiewicz,

The undersigned at American Geotechnical appreciated the opportunity to work with you and the school district in evaluating environmental conditions within six classrooms at the Bridgeport school. Paralleling our work monitoring temperature and relative humidity, vapor emission testing at the slab level was conducted by others. It is understood that there has been some concern about potential mold development in the classrooms.

Accompanying this brief report are our findings for the six individual classrooms along with each classroom identified in sketch form, location of each monitoring instrument indicated. That information is followed by charts of the results of each instrument in each classroom. Thereafter, for each instrument, there is a separate table with statistical analyses of the data. For relative humidity, temperature, and dew point (for a given relative humidity, the temperature at or below which condensation can be expected), means, standard deviation and the 95 percent confidence level upper and lower boundary values are given.

Generally, we find favorable conditions. Mold is a micro biological fungus growth damaging to building contents and potentially harmful to human health. Mold generally requires organic food source which can include numerous construction materials as well as a conducive moisture and temperature environment. The degrees of relative humidity and temperature over which mold can occur is a complex problem, however generally speaking, mold would not be expected in typical classroom environments where relative humidity in generally less than about 50 percent and temperatures are generally less than about 75 degrees. Also, to develop mold, fairly persistent, problematic conditions would need to exist.

File No. 5725-10 September 10, 2019 Page 2

The analysis of the results in each classroom indicates typical variations of a day with no persistent unfavorable conditions. Accordingly, it is this consultant's conclusion that what we found during the course of our study were environmental conditions that were not conducive mold development. Relative humidity, temperature, and dew-point charts for each instrument in each classroom accompany this report. You will see in those charts that the dew-point temperature is consistently below the ambient temperature. Accordingly, condensation moisture would not be expected. During the latter half of the monitoring period, teachers entered classrooms to prepare for the school year. With air conditioning running during those periods, relative humidity and temperature are even lower making fungus/mold growth even less likely.

As for recommendations, we advise that all carpet be breathable. Existing rooms with non-breathable carpet should be removed and replaced as soon as practical. Breathable carpet should work acceptably for VET Valves of up to about 5#/1000 ft²/day. Since all of the Godfrey VET results were less than 5#/1000 ft²/day, the probability of any future microbial growth problem is low. Out of an abundance of caution, you could plan on using a slab seal prior to placement of new carpet for floors not previously sealed. A pore blocking solution, such as Sinak S-102, which is relatively inexpensive, can be expected to cut vapor emissions by about half when applied per the manufacturers specifications (e.g., from this consultant's experience a 4#/1000 ft²/day result will lower to about 2#/1000 ft²/day). At this lower rate, the floors would be suitable to receive any vinyl floor product and/or any breathable carpet material without any significant risk of moisture related problems. The use of a more expensive, high-end polymer sealer such as the UZIN sealer which has already been used in some classrooms should lower the vapor emissions rate to about 1#/1000 ft²/day or less.

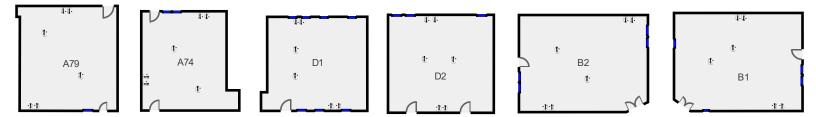

I hope that you find this information useful. Should you have any questions, please do not hesitate to contact our office.

Respectfully submitted, AMERICAN GEOTECHNICAL. IN No. GE103 Gregory W. Axten Principal Engineer/CEO G.E. 103 Enclosure: Appendix A – RH and Temperature Monitoring Distribution: Addressee (Email: sbarankiewicz@ohshlaw.com)
